(54) COLOR ADJUSTMENT DEVICE

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a color adjustment device by which color is simply corrected even when a color sample image outputted from a printer or the like corresponds to a color between two colors in a color sample book.

SOLUTION: In the case that a color adjustment mode is set from a control panel 1 and a density number of a color sample book 6 is entered, a control section 4 corrects data of a lookup table(LUT) 4 into density data corresponding to the density number. In the case that two different density numbers are entered from the control panel 1 once or a plurality of number of times, the control section 2 applies interpolation processing to the density between the density number in response to the entry number of times to correct data in the LUT 4.
